Seamus McAvoy 1343101

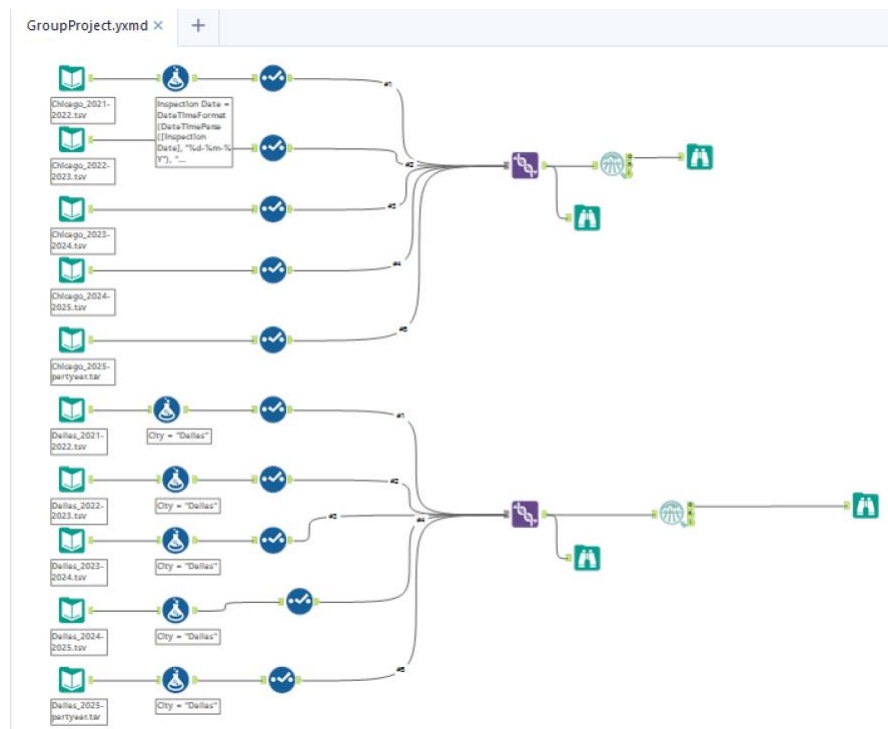

Step 1 – Data Profiling & Standardization

Introduction

The objective of this profiling phase is to comprehensively comprehend, rectify, and standardize food inspection data sourced from two municipalities—Chicago and Dallas—in preparation for constructing a unified dimensional model and subsequently developing downstream BI dashboards.

All profiling and standardization procedures were executed in Alteryx Designer utilizing multiple annual TSV extracts for each city. The primary objective of this phase was to:

- Consolidate multiple yearly files per city into a single standardized dataset
- Assess **data quality** (nulls, types, ranges, and structure)
- Align key attributes across Chicago and Dallas to enable a **shared inspection grain**
- Generate field-level profiling summaries for both cities using Alteryx's **Field Summary Report** macro

Data Source Overview

The raw data provided in the ZIP archive consists of **five yearly slices per city** from 2021 onward.

Chicago files (17 columns each):

Chicago_2021-2022.tsv – 32,804 rows

Chicago_2022-2023.tsv – 35,197 rows

Chicago_2023-2024.tsv – 37,486 rows

Chicago_2024-2025.tsv – 22,100 rows

Chicago_2025-partyear.tsv – 2,875 rows

- Total Chicago records: **130,462** across 17 fields.

Alteryx Workflow Overview

At a high level, the Alteryx workflow performs the following for **each city**:

1. Read all yearly TSV files via multiple Input Data tools.
2. Applied Formula tools where required:
 - Chicago: normalize date format for 2021–2022
 - Dallas: set a standardized City value
3. Applied Select tools to:

- Drop unnecessary fields
 - Rename columns to a common naming standard
 - Enforce appropriate data types (e.g., DateTime, Int64, Double)
4. Used Union tools to vertically stack yearly slices into one unified dataset per city.
 5. Fed each union output into the Field Summary Report macro to generate profiling statistics.
 6. Used Browse tools to visually verify both the row-level data and the profiling output.

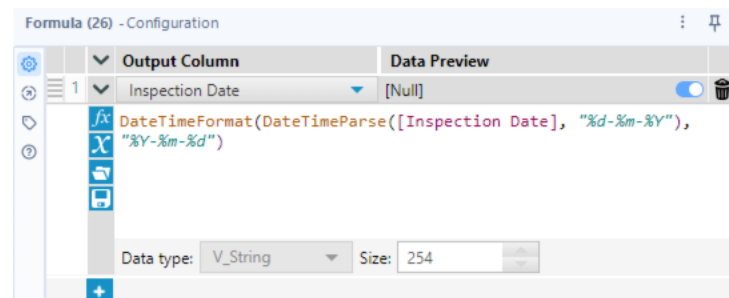

Chicago Data Profiling & Standardization

Chicago data is ingested through five Input Data tools (Tool IDs 1–5), each pointing to one of the Chicago_YYYY-YYYY.tsv files.

For the 2021–2022 file, the raw Inspection Date uses a non-standard day-first format ("%d-%m-%Y"). To normalize this, you used a Formula tool (Tool 26) with:

```
DateTimeFormat(
  DateTimeParse([Inspection Date], "%d-%m-%Y"),
  "%Y-%m-%d"
)
```

- This expression parses the original text date and rewrites it into a consistent YYYY-MM-DD string, which is then later cast to a DateTime type in the Select step.

Union of Chicago Yearly Slices

Once all five yearly streams have been standardized, they are merged using a **Union tool** (Tool 38):

- Inputs: Select tools
- Output: a single consolidated Chicago dataset with 130,462 rows and the standardized field set above.
- The union is configured by field name, ensuring alignment of columns across all years.

The screenshot shows the Alteryx Designer interface. The top part displays a workflow with two input tools (blue circles) feeding into a Union tool (purple square with a plus sign). The Union tool is configured with two inputs labeled #2 and #3. The output of the Union tool is connected to a Browse tool (green binoculars icon). Below the workflow, the 'Results - Union (38) - Output' window is open, showing a table with 15 fields and 3,008 of 130,462 records displayed (partial results).

Record	Inspection_ID	Facility_Name	Alternate_Name	License_Number	Facility_T
1	2485006	JOAN DACHS BAIS	JOAN DACH BAIS	2225390	School
2	2497700	CURLY'S DELI MART	ONE STOP SHOP	2767150	Grocery S
3	2497757	BARRACO'S PIZZA AND THE VINEYARD BANQUE...	BARRACO'S PIZZA AND THE VINEYARD BANQUE...	2636205	Restaurar
4	2497958	HAUGAN ELEMENTARY	HAUGAN ELEMENTARY	23591	School
5	2498100	White	White	26431	School
6	2500617	ISLAND VIBES	ISLAND VIBES	2636476	Restaurar

Field-Level Profiling (Chicago)

The output of the Chicago union feeds into:

- Field Summary Report macro (Tool 42), which generates:
 - Data type per field
 - Record count
 - Number and percentage of null/blank values
 - Distinct value counts
 - Basic numeric statistics where applicable
- Browse tool (Tool 50), which shows standardized row-level Chicago data.

From the combined Chicago dataset, the key profiling observations are:

Record volume & date range

- Total rows: 130,462
- Inspection_Date range: 2021-01-04 to 2025-03-05

Key interpretations:

- Chicago is complete for **core inspection attributes** (facility, date, type, result)
- Nine records lack a Zip_Code, which must be **dropped or repaired** in the silver zone per assignment rules.

- Approximately **31% of inspections** lack a Violation_Description, indicating either no recorded violations or missing detail. This is important for building the violation dimension and applying the “at least one violation per inspection” rule.

Dallas Data Profiling & Standardization Ingestion and City Normalization

Dallas data is ingested through five Input Data tools (Tool IDs 7, 8, 9, 10, 22), each pointing to one of the Dallas_YYYY-YYYY.tsv files, each with 114 columns.

In contrast to Chicago, the Dallas files do not include a dependable City column within the selected subset. To standardize the city indicator, you developed a Formula tool for each annual slice (Tools 32, 33, 34, 35, 36) with the following specifications:

[City] = "Dallas"

Union of Dallas Yearly Slices

Like Chicago, the standardized Dallas streams are then vertically stacked using a Union tool (Tool 39):

- Inputs: Select tools 16, 17, 18, 19, 20
- Output: a consolidated Dallas dataset with 47,219 records and the standardized fields above.

The union is again configured by field name.

The screenshot displays the Alteryx workflow interface. At the top, a Union tool (Tool 39) is configured with five input streams labeled #2, #3, #4, #5, and #6. Below the workflow, the 'Results - Union (39) - Output' window is open, showing a table of 10 records. The table has 8 columns: Record, Facility_Name, Inspection_Type, Inspection_Date, Violation_Score, Address, Zip_Code, and Month. The first 10 records are displayed, showing various facilities like SAMS CLUB, AMC THEATRES, and AFC SUSHI.

Record	Facility_Name	Inspection_Type	Inspection_Date	Violation_Score	Address	Zip_Code	Month

Field-Level Profiling (Dallas)

- **Field Summary Report macro** (Tool 47)
- **Browse tools** (Tools 49 – data, 48 – report)

Key profiling observations from the unified Dallas dataset

- **Total rows:** 47,219
- **Inspection_Date range:** 2021-01-02 to 2024-02-29 (2025 has no data)

Missing value analysis (key fields)

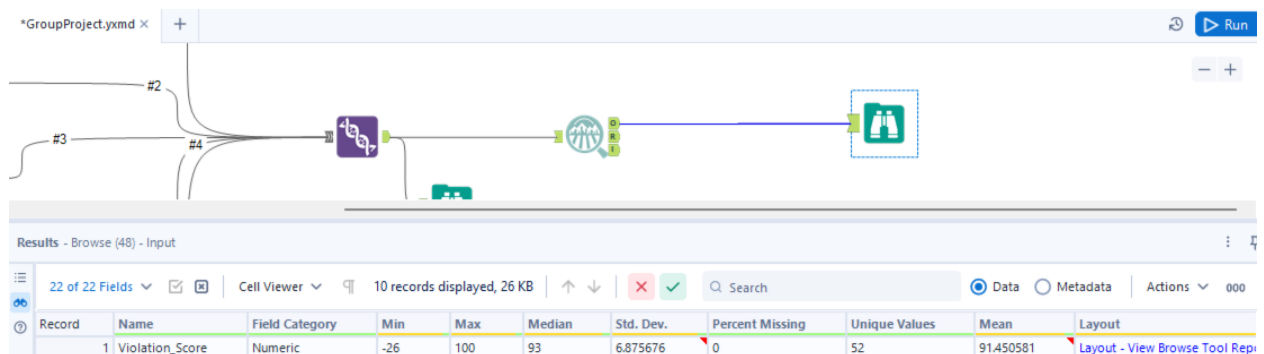

Dallas is very complete for the selected core fields; no missing values were observed in the chosen subset.

Score range:

Violation_Score minimum: **-26**

Violation_Score maximum: **100**

The upper limit of 100 matches the assignment rule: “Dallas violation score cannot be more than 100”. But the presence of negative scores (like -26) is a bit odd and suggests either data entry problems or a scoring issue that needs checking out. We’ll need to add some validation logic in the silver zone (like flagging or dropping negative scores) before enforcing the business rules.

Record	Name	Field Category	Min	Max	Median	Std. Dev.	Percent Missing	Unique Values	Mean	Layout
1	Violation_Score	Numeric	-26	100	93	6.875676	0	52	91.450581	Layout - View Browse Tool Rep

Cross-City Standardization Status

The profiling workflow achieves **partial but strong standardization** between Chicago and Dallas at the inspection level.

Aligned fields across both cities:

- Facility_Name
- Inspection_Type
- Inspection_Date (DateTime)
- Zip_Code (Int64)
- Location
- City

Chicago-only fields (currently):

- Inspection_ID
- Alternate_Name
- License_Number
- Facility_Type
- Risk_Category
- State
- Inspection_Result
- Violation_Description

Dallas-only fields (in profile subset):

- Violation_Score
- Month
- Year

Right now, the main inspection details are the same in all cities. We're saving more specific details about violations (like making sure Dallas's "Violation Description – 1.N" columns match Chicago's free-text Violation_Description) for later.

Key Data Quality Observations

From the profiling work, the main data quality findings are:

Chicago

Core inspection attributes (Facility_Name, Inspection_Date, Inspection_Type, Inspection_Result, Zip_Code) are almost fully populated.

Zip_Code has only 9 missing values (0.01%), which will be removed or treated per Silver-zone rules.

Approximately 31% of records lack a Violation_Description, which will impact violation-level analyses and the mandate that "every inspection must have at least one distinct violation."

The dates span multiple years and were successfully normalized to a uniform format.

Dallas

Selected fields are fully populated (0% null for key attributes).

Violation_Score stays within the upper limit of 100 but has negative values, which are likely invalid and will need to be addressed.

Dallas schema is very wide (114 columns), but the profiling subset intentionally focuses on inspection-level information for later fact-table design.

Cross-City Consistency

Both cities now expose a common set of inspection-level attributes suitable for a unified **fact_inspection** grain.

City is explicit and consistent: Chicago via source data, Dallas via Formula ("Dallas").

Naming conventions and core data types have been aligned to support downstream Silver/Gold transformations.

Readiness for Silver Zone & Dimensional Modeling

The current profiling workflow achieves the main goals of **Part 1** of the assignment:

- All yearly files per city are consolidated into single standardized datasets.
- Key fields have been renamed and retyped to a shared convention.

- Field Summary Reports provide evidence of data quality (nulls, types, distributions).
- Major issues and edge cases (missing zips, empty violation descriptions, negative Dallas scores) have been identified and documented.
- These outputs are now ready to feed into:

Silver zone:

- Apply explicit validation rules (drop null zips, enforce score bounds, handle missing results/violations).
- Begin deriving Chicago Violation_Score from Inspection_Result.

Gold zone / dimensional model:

- Design a unified fact_inspection table leveraging the standardized schema.
- Implement SCD2 on an appropriate dimension (e.g., dim_facility).
- Introduce a cross-city dim_violation that can handle both Chicago's free-text violations and Dallas's structured violation fields.

Silver layer (last step):

The screenshot displays the Databricks interface with a SQL query executed on a table named 'restaurant_pipeline'. The query is: `1 for t in [`. The results are shown in a table with 8 columns: `inspection_key`, `latitude`, `longitude`, `facility_name`, `aka_name`, `facility_type`, `address_line`, and `zip_code`. The table contains 27 rows of data, representing various restaurants and food facilities. The interface includes a sidebar with navigation options like Workspace, Recent, Catalog, Jobs & Pipelines, Compute, and Marketplace. The top bar shows the workspace name 'damg7270' and various action buttons like Run, Edit, and Schedule.

Power BI Desktop interface showing a data table with columns: facility_name, facility_type, address_line, zip_code, inspection_type, violation_score, city_name, Year, Quarter, Month. The table contains 50 rows of data. The interface includes a ribbon with tabs: File, Home, Insert, Modeling, View, Optimize, Help. The Home tab is active, showing options like Paste, Cut, Copy, Format painter, Clipboard, Get data, Excel, OneLake, SQL, Enter data, Datasource, Recent sources, Transform data, Refresh, New visual, Text box, More visuals, New visual calculation, Measure, Quick measure, Sensitivity, Publish, Prep data for Copilot, and Copilot. The right sidebar shows Filters, Visualizations, and Data panes. The Data pane lists fields: location_id, longitude, zip_code, dim_violation (Column1, Column2, Column3, Column4, Column5), fact_inspection (Average Viola..., Chicago Inspec..., Deltas Inspec..., date_key, facility_key, inspection_key, location_key, loaded_timest..., Total Inspec..., Total Violations, violation_score).
